

Problem 4. Consider the following graph (10 points, 100% of total score).

1. Consider the graph above and its vertices. Which vertices are adjacent to each other? (10 points, 100% of total score)
2. Using the graph above, construct a spanning tree for the graph. Which edges are in the spanning tree? (10 points, 100% of total score)

3. Using the graph above, construct a spanning tree for the graph. Which edges are in the spanning tree? (10 points, 100% of total score)

4. Using the graph above, construct a spanning tree for the graph. Which edges are in the spanning tree? (10 points, 100% of total score)

Problem 2. Consider the following graph

- a. Using 0 as your source, construct a spanning tree for the given graph using a depth-first process.

- b. Using 1 as your source, construct a spanning tree for the given graph using a depth-first process.

- c. Using 8 as your source, construct a spanning tree for the given graph using a depth-first process.

Problem 3. (Bonus) Implement a breadth and/or depth first search to determine all of the vertices/nodes that can be reached starting at 0 (or general i). Return a list of visited vertices as well as a data structure to that encodes the resulting tree.
